ChatGPT

2/2

Sure! Let's go through the code step by step.

First, we need to import the required libraries. In this code, we are using numpy, pandas, seaborn, and matplotlib.pyplot. These libraries provide various functionalities for data manipulation, analysis, and visualization

| | / code | | | | | | | |
|---|-------------------------|-------------|----------|----------------|---------------|------------|---------------|-----------------------|
| import | as in | nport | as | import | as | impor | t | as |
| NIt | | | CC// CI | 11 1 | | | | |
| | | | | | placement | _aata.csv | using pand | as' read_csv (|
| function a | nd store it i | n a DataFra | me calle | ed df . | | | | |
| | | | | | | | | |
| pythonCopy | / code | | | | | | | |
| | r"plac | ement_data. | csv" pi | int "Pla | cement data | set is suc | essfully load | ed into Data |
| Frame" | | | | | | | | |
| 1 1 (4111 61111 | | | | | | | | |
| T | | | | | : - : - £ +: | | : | |
| | tand the dai | aset, we di | spiay sc | ime basi | ic informati | on about | it using vari | ous pandas |
| | | | | | | | | |
| functions. | | | | | | | | |
| tunctions. | | | | | | | | |
| runctions. pythonCopy | [,] code | | | | | | | |
| pythonCopy | / code ormation of D | ataset: \n" | | print "S | Shape of Dat | aset (row | x column):" | |
| pythonCopy print "Info | | | print | | Shape of Dat | _ | | "Datatype of |
| pythonCopy print "Info print "Col | ormation of D | | | | elements in c | lataset:" | | |

The info() function provides a summary of the dataset, including the number of rows, columns, column names, and the data type of each column. The **shape** attribute gives the dimensions of the dataset (number of rows x number of columns). The columns attribute lists the names of all the columns in the dataset. The **size** attribute gives the total number of elements in the dataset. The dtypes attribute shows the data type of each column in the dataset. The **head()** function displays the first 5 rows of the dataset. The tail () function displays the last 5 rows of the dataset. The sample () function displays any 5 random rows from the dataset. After displaying the basic information, we move on to analyze the statistical information of the numerical columns in the dataset using the describe() function. pythonCopy code print "Statistical information of Numerical Columns: \n" The describe() function provides various statistical measures like count, mean, standard deviation, minimum value, 25th percentile, median, 75th percentile, and maximum value for the numerical columns in the dataset. Next, we check for null values in the dataset using the isna(). sum() function. pythonCopy code print "Total Number of Null Values in Dataset:" sum The isna() function returns a DataFrame with the same shape as the original dataset, where each element is a Boolean value indicating whether the corresponding element in the original dataset is missing or not. The sum() function then sums up the number of missing values in each column. After that, we perform data type conversions on specific columns in the dataset. pythonCopy code print "Converting Data type of variables: " "int8" | print | "Check Datatype "sl no" "sl no" of sl_no" "ssc_p" "ssc_p" "int8" | print | "Check Datatype of ssc_p" Here, we convert the "sl_no" column and "ssc_p" column to the int8 data type using the astype () function. This conversion helps in reducing memory usage if the values in these columns can be represented within the int8 range.

| Next, we perform label encoding on a representation. | categorical (| column to c | onvert it into a qu | Jantitative |
|--|-----------------|----------------------------|---------------------|---------------------|
| pythonCopy code | | | | |
| print "Encoding using Label Encoding (| Cat Codes)" | "gender" | "gender" | "category" |
| print "Data types of Gender=" | "gender" | "gender" | "gender" | print "Data |
| types of gender after label encoding =" | 'gen | der' print | "Gender Values:" | |
| "gender" | | | | |
| In this code snippet, we first convert the cat. codes attribute to assign a nur This effectively converts the categoric unique values of the "gender" column | merical code to | to each unio numeric re | que category in th | ne "gender" column. |
| Lastly, we perform normalization on t technique. | he "salary" co | olumn using | g the Min-Max fea | ture scaling |
| pythonCopy code | | | | |
| print "Normalization using Min-Max Fe | ature Scaling: | "salary | "salary" | "salary" min |
| "salary" max "salary" min | print | | - | |

Here, we subtract the minimum value of the "salary" column from each element and divide it by the range (maximum value minus minimum value) of the "salary" column. This scales the values in the "salary" column between 0 and 1, making them normalized.

That's the end of the code explanation!

#Assignment No. 2 Data Wrangling II Program by Prof. Rahul Dagade & Prof. Varsha Nale def RemoveOutlier(df,var): Q1 =df[var].quantile(0.25) Q3 =df[var].quantile(0.75) IQR = Q3-Q1 high, low=Q3+1.5*IQR, Q1-1.5*IQR df=df[((df[var] >= low) & (df[var] <= high))] print("Outliers removed in", var) return df def DisplayOutliers(df, message): fig, axes = plt.subplots(2,2) fig.suptitle(message) sns.boxplot(data=df, x="raisedhands", ax=axes[0,0]) sns.boxplot(data=df, x="VislTedResources", ax=axes[0,1]) sns.boxplot(data=df, x="AnnouncementsView", ax=axes[1,0]) sns.boxplot(data=df, x="Discussion", ax=axes[1,1]) fig.tight_layout() plt.show() #import libraries import numpy as np import pandas as pd import seaborn as sns import matplotlib.pyplot as plt #Read Dataset df=pd.read_csv(r"C:\Users\niraj\Downloads\student_data.csv") print("Student Academic Performance Dataset is successfully loaded...") #Display information of dataset print("Information of Dataset\:n", df.info) print("Shape of Dataset (row x column):", df.shape) print("Columns Name:", df.columns) print("Total elements in dataset:", df.size) print("Datatype of attributes {columns}:", df.dtypes) print("First 5 rows: \n",df.head().T) print("Last 5 rows:\n",df.tail().T) print("Any 5 rows:\n",df.sample(5).T) #Display statistical information of dataset print("Statistical information of

ChatGPT

Sure! Let's break down the code step by step:

First, we have two functions defined: RemoveOutlier (df, var) and DisplayOutliers (df, message). These functions are used for outlier removal and displaying outliers respectively.

| pytho | nCopy code | | | | |
|-------|--------------|---------------------|---------------------|----------------------|-----|
| def R | .emoveOutlie | r | 0.25 | 0.75 | |
| | 1.5 | 1.5 | | print "Outliers remo | ved |
| in" | return | def DisplayOutliers | | 2 2 | |
| | | "raisedhands" | 0 0 | "VisITedResources" | |
| | 0 1 | | "AnnouncementsView" | 1 0 | |
| "D | iscussion" | 1 1 | | | |

The RemoveOutlier() function takes two arguments: df (the DataFrame) and var (the variable/column name). It removes outliers from the specified column using the Interquartile Range (IQR) method. It calculates the first quartile (Q1), third quartile (Q3), and IQR, and then defines the upper and lower thresholds for outliers. It filters the DataFrame based on these thresholds and returns the modified DataFrame.

The <code>DisplayOutliers()</code> function takes two arguments: <code>df</code> (the DataFrame) and <code>message</code> (a string for the plot title). It displays boxplots for four columns ("raisedhands", "VislTedResources", "AnnouncementsView", and "Discussion") using seaborn's <code>boxplot()</code> function. The boxplots are arranged in a 2x2 grid using subplots. The <code>message</code> string is used as the main title of the figure. The function then shows the plot.

Next, we import the required libraries: numpy, pandas, seaborn, and matplotlib.pyplot.

| pythonCopy co | de | | | | | | |
|---------------|----|--------|----|--------|----|--------|----|
| import | as | import | as | import | as | import | as |

We read the dataset from a CSV file called "student_data.csv" using pandas' read_csv() function and store it in a DataFrame called df.

| pythonCopy code | | | |
|------------------------|---------------------------------------|-----------------------|-------------------------------------|
| r"C | ::\Users\niraj\Downloads\stud | ent_data.csv" | "Student Academic Performance |
| Dataset is successful | ly loaded" | | |
| | | | |
| To understand the | dataset, we display some bas | ic information abo | ut it using various pandas |
| functions. | , , , | | 3 |
| | | | |
| pythonCopy code | | | |
| print "Information of | of Dataset:\n" print "S | hape of Dataset (rov | w x column)." |
| print "Columns Nan | | elements in dataset:' | |
| | | | print "Last 5 rows:\n" |
| attributes {columns} | | vs. \II | print Last 3 rows. \II |
| print "Any 5 rows:\ | n" <u>5</u> | | |
| | | | |
| These functions pro | ovide information about the c | lataset, such as the | number of rows and columns, |
| column names, dat | ta types, and a preview of the | data. | |
| | | | |
| We then display the | e statistical information of the | numerical columr | ns using the describe() function. |
| | | | |
| pythonCopy code | | | |
| | formation of Numerical Columns | s:\n" | |
| | | | |
| The describe () fund | ction provides various statistic | al measures like co | ount, mean, standard deviation, |
| | • | | |
| | ith percentile, median, 75th pe | ercentile, and maxi | mum value for the numerical |
| columns in the data | aset. | | |
| | | | |
| Next, we check for | null values in the dataset using | ng the isna().sum() | function. |
| | | | |
| pythonCopy code | | | |
| print "Total Numbe | er of Null values in Dataset:\n" | sum | |
| | | | |
| The isna() function | returns a DataFrame with the | e same shape as th | e original dataset, where each |
| element is a Boolea | an value indicating whether th | ne corresponding e | lement in the original dataset is |
| missing or not. The | sum() function then sums up | the number of mis | ssing values in each column. |
| J | • | | 3 |
| After that we hand | lle outliers in the dataset usin | n the DisplayOutlie | rs() and RemoveOutlier() functions. |
| rater triat, we rialla | ne outhers in the dutaset asing | g the broprayoutries | row and monovoderror y ranctions. |
| pythonCopy code | | | |
| | "Before removing Outliers" | | "raisedhands" |
| | | шА | |
| | VisITedResources" | | incementsView" |
| " | 'Discussion" | "After removing 0 | utliers" |
| | | | |
| We display the out | liers before and after removin | g them using boxp | plots. The DisplayOutliers () |
| function is called w | rith the original df DataFrame | and a message for | the plot title. Then, the |
| RemoveOutlier() fun | ction is called for each column | n to remove the ou | Itliers from the DataFrame. The |
| | ne is assigned back to df . | | |

Next, we perform label encoding on the "gender" column to convert it into a quantitative representation.

pythonCopy code

| "gender" | "gender" | "category" | "gender" | "gender" | print | "Data types of |
|------------------|----------------|------------|------------|--------------|----------|----------------|
| gender after lab | el encoding =" | 'gender' | print "Gen | der Values:" | "gender" | |

Here, we convert the "gender" column to the category data type and then use the cat. codes attribute to assign a numerical code to each unique category. We display the data type of the "gender" column after label encoding and the unique values of the "gender" column.

Finally, we use seaborn to create boxplots and scatterplots to visualize relationships between variables.

pythonCopy code

| "gender" "raisedhands" | "gender" | "Boxplot with 2 variables |
|---|---------------|-----------------------------|
| gender and raisedhands" | "NationalITy" | "Discussion" "gender" |
| "Boxplot with 3 variables gender, nationality, di | scussion" | print "Relationship between |
| variables using Scatterplot:" | "raisedhands" | "VisITedResources" |
| "Scatterplot for raisedhands, VisITedResources" | • | |

These plots show the relationship between variables. The first boxplot shows the relationship between "gender" and "raisedhands". The second boxplot shows the relationship between "gender", "NationallTy", and "Discussion". Finally, the scatterplot shows the relationship between "raisedhands" and "VislTedResources".

That's the end of the code explanation!

ChatGPT
Sure! Let's go through the code step by step:
First, the required libraries are imported: pandas, seaborn, matplotlib.pyplot, and numpy.
 pythonCopy code
import
                                                                                   import
                                                                                                                                                                            import
                                                                                                                                                                                                                                                                                                      import
Next, the dataset is read from a CSV file called "Employee_Salary.csv" using pandas' read_csv()
function, and it is stored in a DataFrame called df.
 pythonCopy code
                                                                  successfully loaded.\n"
Information about the dataset is displayed using various pandas functions.
pythonCopy code
print "Iris Dataset is successfully loaded..." print "Information of Dataset:\n"
                                                                                                                                                                                                                                                                                                                                           print "Shape of
Dataset (row x column):"
                                                                                                                                       print "Columns Name: df.columns" print "Total elements in
                                                                       print "Datatype of attributes (columns):"
 dataset:"
                                                                                                                                                                                                                                                                                print "First 5 rows: \n"
                                                print "Last 5 rows: \n"
                                                                                                                                                                                     print "Any 5 rows: \n"
These functions provide information about the dataset, such as the number of rows and columns,
column names, data types, and a preview of the data.
The statistical information of numerical columns is computed and displayed using a for loop.
pythonCopy code
```

| <pre>print "Statistical information of Numerical Columns: \n"</pre> | "Experience_Years" |
|---|--|
| print "{:<20}{:<10}{:<10}{:<20}{:<20}" format "(| Columns" |
| "Min" "Max" "Mean" "Median" "STD" for in | |
| min max | |
| print "{:<20 | 0}{:<10}{:<10}{:<20}{:<20}" |
| 5 | |
| | |
| This loop calculates and prints the minimum, maximu | ım, mean, median, and standard deviation for |
| each column in the columns list. | |
| | |
| Next, a groupwise statistical summary is computed an | nd displayed. |
| | |

- 3. Various operations are performed on the DataFrame to gather information about the dataset:
 - **info()** displays the summary information of the DataFrame, including the data types and non-null counts of each column.
 - **size** returns the total number of elements in the DataFrame.
 - **shape** returns the dimensions (rows, columns) of the DataFrame.
 - columns returns the names of the columns.
 - head () displays the first few rows of the DataFrame.
 - tail() displays the last few rows of the DataFrame.
 - sample() displays a random sample of rows from the DataFrame.
 - **describe()** provides descriptive statistics of the numeric columns in the DataFrame.
 - **dtypes** returns the data types of each column.
 - isnull().sum() and isna().sum() return the count of missing values in each column.

Here's a breakdown of the code: 1. Import the required libraries: numpy, pandas, seaborn, and matplotlib. pythonCopy code import import import import as as 2. Read the Titanic dataset into a DataFrame. pythonCopy code 3. Display the information of the dataset using info(), the shape of the dataset using shape, column names using columns, total elements using size, data types of attributes using dtypes, and the first 5 rows using head(). pythonCopy code print "Shape of Dataset (row x column):" print "Information of Dataset:\n" print "Total elements in dataset:" print "Columns Name:" print "Datatype of attributes (columns):" print "First 5 rows:\n" 4. Find missing values in the dataset using isnull(). sum(). pythonCopy code print "Missing values" print sum 5. Fill the missing values in the "Age" column with the median value using fillna(). pythonCopy code "Age" True print "Null values are:\n" "Age" 6. Create boxplots for one variable, "Age" and "Fare", using boxplot () from seaborn. pythonCopy code 1 2 "Boxplot of 1-variables (Age & Fare)" "Age" "Fare" 7. Create boxplots for two variables, "Age" and "Fare", with the hue "Survived" and "Sex" using boxplot() from seaborn. pythonCopy code "Boxplot of 2-variables" "Survived" 0 0 "Survived" "Survived" "Age" "Survived" "Fare" 0 1 "Sex" "Sex" 1 0 "Age" "Sex" "Fare" "Sex" 1 1 8. Create boxplots for three variables, "Sex", "Age", and "Fare", with the hue "Survived" using **boxplot()** from seaborn. pythonCopy code

| 1 | 2 | "Boxplot of 3-variable | es" | | "Sex" | "Age" |
|------------|---|------------------------|--------|------------|-------|-------|
| "Survived" | 0 | "Sex" | "Fare" | "Survived" | | 1 |

These boxplots provide a visual representation of the distribution of variables in the Titanic dataset, allowing for the analysis of central tendency, variability, and potential outliers.

Assignment no, 10 Data Visualization on IRIS Dataset (Histogram & Boxplot) # import libraries import numpy as np import pandas as pd import seaborn as sns import matplotlib.pyplot as plt #Read Dataset df=pd.read_csv(r"iris - 2023-05-20T153708.481.csv") print("iris dataset is successfully loaded into Data Frame....") #Display information of dataset print("Information of Dataset: \n", df.info) print("Shape of Dataset (row x column):",df.shape) print("Columns Name:", df.columns) print("Total elements in dataset:", df.size) print("Datatype of attributes (columns):", df.dtypes) print("First 5 rows: \n", df.head().T) print("Last 5 rows:\n",df.tail().T) print("Any 5 rows: \n",df.sample(5).T) #Find missing values print ("Missing values") print(df.isnull().sum()) #Histogram of 1-variable fig, axes= plt.subplots(2,2) fig.suptitle("Histogram 1-variables") sns.histplot(data=df,x="sepal.length", ax=axes[0,0]) sns.histplot(data=df,x="sepal.width", ax=axes [0,1]) sns.histplot(data=df,x="petal.length", ax=axes[1,0]) sns.histplot(data=df,x="petal.width", ax=axes[1,1]) plt.show() #Histogram of 2-variables fig, axes =plt.subplots(2,2) fig.suptitle("Histogram of 2-variables") sns.histplot(data=df, x="sepal.length",hue="variety", multiple="dodge", ax=axes[0,0]) sns.histplot(data=df, x="sepal.width",hue="variety", multiple="dodge", ax=axes[0,1]) sns.histplot(data=df, x="petal.length",hue="variety", multiple ="dodge",ax=axes[1,0]) sns.histplot(data=df, x="petal.width",hue="variety", multiple="dodge", ax=axes[1,1]) plt.show() #Boxplot of 1-variable. fig, axes= plt.subplots(2,2) fig.suptitle("Boxplot of 1-variables") sns.histplot(data=df,x="sepal.length", ax=axes[0,0]) sns.histplot(data=df,x="sepal.width", ax=axes [0,1]) sns.histplot(data=df,x="petal.length", ax=axes[1,0]) sns.histplot(data=df,x="petal.width", ax=axes[1,1]) plt.show() #Boxplot of 2-variables fig, axes =plt.subplots(2,2) fig.suptitle("Histogram of 2-variables") sns.histplot(data=df, x="sepal.length",y="variety", hue="variety", ax=axes[0,0]) sns.histplot(data=df, x="sepal.width",y="variety", hue="variety", ax=axes[0,1]) sns.histplot(data=df, x="petal.length",y="variety", hue="variety",ax=axes[1,0]) sns.histplot(data=df, x="petal.width",y="variety", hue="variety", ax=axes[1,1]) plt.show()

ChatGPT

The code provided performs data visualization on the Iris dataset using histograms and boxplots. Here's a breakdown of the code:

Import the required libraries: numpy, pandas, seaborn, and matplotlib.

pythonCopy code

import as import as import as import as pythonCopy code

2. Read the Iris dataset into a DataFrame.

pythonCopy code

| r"iris - 2023-05-20T153708.481.csv" print "Iris dataset is successfully loaded into | Data |
|---|----------|
| Frame" | |
| 3. Display the information of the dataset using info(), the shape of the dataset using shap | е, |
| column names using columns, total elements using size, data types of attributes using d | |
| and the first 5 rows using head(). | |
| pythonCopy code | |
| print "Information of Dataset:\n" print "Shape of Dataset (row x column):" | |
| print"Columns Name:"print"Total elements in dataset:"print"Datatype of | |
| attributes (columns):" print "First 5 rows:\n" | |
| 4. Find missing values in the dataset using isnull().sum(). | |
| pythonCopy code | |
| print "Missing values" print sum | |
| 5. Create histograms for one variable, "sepal.length", "sepal.width", "petal.length", and | |
| "petal.width" using histplot() from seaborn. | |
| pythonCopy code | T |
| 2 2 "Histogram 1-variables" "sepal.leng | th" |
| 0 0 "sepal.width" 0 1 | |
| "petal.length" 1 0 "petal.width" 1 1 | |
| 6. Create histograms for two variables, "sepal.length", "sepal.width", "petal.length", and | |
| "petal.width", with the hue "variety" using histplot() from seaborn. | |
| pythonCopy code 2 2 "Histogram of 2-variables" "sepal.le | .1.11 |
| | |
| "variety" "dodge" 0 0 "sepal.width" "variet | |
| | odge" |
| 1 0 "petal.width" "variety" "dodge" 1 | <u>L</u> |
| 7 Create beyond to for one veriable "conclinate" "conclinidate" "potal langth" and | |
| 7. Create boxplots for one variable, "sepal.length", "sepal.width", "petal.length", and | |
| "petal.width" using boxplot () from seaborn. pythonCopy code | |
| "Boxplot of 1-variables" "sepal.lengt" | ·h" |
| 0 0 "sepal.width" 0 1 "petal.le | |
| 1 0 "petal.width" 1 1 | ,iigtii |
| 8. Create boxplots for two variables, "sepal.length", "sepal.width", "petal.length", and | |
| "petal.width", with the hue "variety" using boxplot () from seaborn. | |
| pythonCopy code | |
| "Boxplot of 2-variables" "sepal.lengt | h" |
| "variety" "variety" 0 0 | |
| "variety" 0 1 "petal.length" "variety" "variety" | |
| 1 0 "petal.width" "variety" 1 1 | |
| F | |
| | |
| These visualizations provide insights into the distribution and variation of the Iris dataset using | ı |
| histograms and boxplots. They help in understanding the characteristics and relationships between | |
| different variables in the dataset. | |
| | |
